

Description

The 9DMV0141 is a member of IDT's SOC-Friendly 1.8V Very-Low-Power (VLP) PCIe Gen1-2-3 family. It has integrated output terminations providing $Z_0=100\Omega$ for direct connection to 100Ω transmission lines. The output has an OE# pin for optimal system control and power management. The part provides asynchronous or glitch-free switching modes.

Typical Application

2:1 PCIe Gen1-2-3 Clock Multiplexer

Output Features

- 1 -Low-Power (LP) HCSL DIF pair w/ $Z_0=100\Omega$

Key Specifications

- DIF *additive* cycle-to-cycle jitter <5ps
- DIF phase jitter is PCIe Gen1-2-3 compliant
- 125MHz additive phase jitter 420fs rms typical (12kHz to 20MHz)

Features

- LP-HCSL output w/integrated terminations; saves 4 resistors compared to standard HCSL output
- 1.8V operation; 12mW typical power consumption
- Selectable asynchronous or glitch-free switching; allows the mux to be selected at power up even if both inputs are not running, then transition to glitch-free switching mode
- Spread Spectrum Compatible; supports EMI reduction
- OE# pins; support DIF power management
- HCSL differential inputs; can be driven by common clock sources
- 1MHz to 200MHz operating frequency
- Configuration can be accomplished with strapping pins; SMBus interface not required for device control
- Space saving 16-pin 3x3mm VFQFPN; minimal board space

² Measured from differential waveform

³ Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

⁴ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁵ V_{cross} is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

⁶ The total variation of all V_{cross} measurements in any particular system. Note that this is a subset of V_{cross_min}/max (V_{cross} absolute) allowed. The intent is to limit V_{cross} induced modulation by setting Δ-V_{cross} to be smaller than V_{cross} absolute.
