8/4-Output PCIe Gen1/2/3/4/5 Clock Buffer

The Si53258/54 are the industry's highest performance and lowest power automotive grade PCI Express fanout buffers for PCIe Gen1/2/3/4/5 common clock and/or SRIS applications. The Si53258 and Si53254 source eight and four 100 MHz PCIe differential clock outputs, respectively. All clock outputs are compliant to PCIe Gen1/2/3/4/5 common clock and separate reference clock architecture specifications.

Hardware control pins are available for enabling and disabling the outputs, as well as input selection for devices that include dual-input functionality.

For more information about PCI Express, Skyworks' complete PCIe portfolio, application notes, and design tools, including the Skyworks PCIe Clock Jitter Tool for PCI Express compliance, please visit the Skyworks PCI Express Learning Center.

Applications:

- Infotainment
- ADAS ECU
- Radar Sensors
- LiDar Sensors

KEY FEATURES

- 8/4-outputs with internal termination
- PCIe Gen 1/2/3/4/5 compliant
- Automotive grade 2: -40 to +105 °C
- Internal 100 Ω or 85 Ω line matching
- Excellent additive jitter performance
 - 0.05 ps RMS (Gen3/4)
 - 0.025 ps RMS (Gen5)
- Spread spectrum tolerant to pass through a spread input clock for EMI reduction
- Individual hardware control pins for Output Enable
- Optional dual input capability with MUX
- 1.8–3.3 V power supply
- Pb-free, RoHS-6 compliant

3.2 HCSL Differential Output Terminations

Termination for HCSL Outputs

The Si52254/8 HCSL driver features integrated termination resistors to simplify interfacing to an HCSL receiver. The HCSL driver supports both 100 Ω and 85 Ω transmission line options, and can be selected using the IMP_SEL hardware input pin.

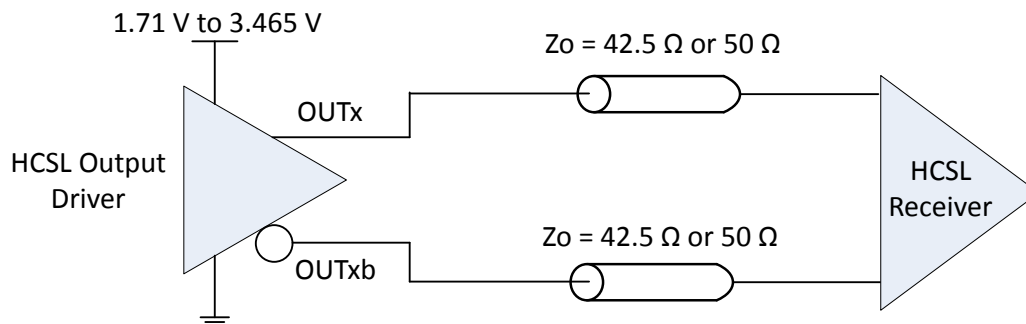

Figure 3.5. HCSL Internal Termination Mode

3.3 Output Enable/Disable

An output enable pin provides a convenient method of disabling or enabling the output drivers. When the output enable pin is held high, all designated outputs will be disabled. When held low, the designated outputs will be enabled.

3.4 Loss of Signal (LOS)

The LOS indicator is used to check for the presence of an input reference source (crystal or clock). LOS will assert when the reference source frequency drops below approximately 10 MHz.

The LOS pin must be checked prior to selecting the clock input or should be polled to check for the presence of the currently selected input clock. In the event that a reference source is not present, the associated LOS pin will assume a logic low (LOS = 0) state. When a reference source is present at the associated input clock pin, the LOS pin will assume a logic high (LOS = 1) state.

4. Power Supply Filtering Recommendations

The Si53258/4 features internal LDOs on each power supply pin, providing excellent power supply noise rejection. As a guideline, each power supply pin should use a parallel combination of a 1 μ f and a 0.1 μ F bypass capacitor placed as close to the supply pin as possible.

Notes:

1. Measure taken from differential waveform on a component test board. The edge (slew) rate is measured from –150 mV to +150 mV on the differential waveform. Scope is set to average because the scope sample clock is making most of the dynamic wiggles along the clock edge. Only valid for Rising clock and Falling Clock#. Signal must be monotonic through the Vol to Voh region for Trise and Tfall.
2. Applies to a 2 pF load with both internal or external 50 Ω or 42.5 Ω R_p.
3. Measurement taken from differential waveform.
4. Measurement taken from Single Ended waveform.
5. Measured with oscilloscope, averaging off, using min max statistics. Variation is the delta between min and max.

6. Measured at crossing point where the instantaneous voltage value of the rising edge of CLK equals the falling edge of CLK#.
7. This measurement refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing.
8. ΔVcross is defined as the total variation of all crossing voltages of Rising CLOCK and Falling CLOCK#. This is the maximum allowed variance in Vcross for any particular system.
9. Overshoot is defined as the absolute value of the maximum voltage.
10. Undershoot is defined as the absolute value of the minimum voltage.

Notes:

1. Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as specified in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Number	Pin Name	Pin Type	Function
1	VDD_DIG	P	Voltage supply for digital functions. Connect to 1.8–3.3 V. Part of internal core VDD voltage. Must be connected to same voltage as VDDA and VDD.
2	CLK_IN	I	100 MHz HCSL Clock Input
3	CLK_INb	I	These pins are high-impedance and must be terminated externally.
4	VDD		Voltage supply. Connect to 1.8–3.3 V. Part of internal core VDD voltage. Must be connected to same voltage as VDDA and VDD_DIG.
5	NC	—	Do not connect these pins to anything.
6	NC	—	
7	VDDA	P	Core Supply Voltage. Connect to 1.8–3.3 V. See the Si5332-AM1/2/3 Family Reference Manual for power supply filtering recommendations. Must be connected to same voltage as VDD_DIG and VDD.

Pin Number	Pin Name	Pin Type	Function
8	LOS	O	<p>The LOS status pin indicates whether the reference clock input is above 10 MHz. LOS is active low, open drain output and requires an external pull-up resistor of 1 to 10 kΩ for proper operation. If LOS is not required, this pin can be left unconnected.</p> <p>0 = reference input has dropped below 10 MHz</p> <p>1 = reference present (>10 MHz)</p>

10. Revision History

Revision 1.0

January, 2021

- Updated notes in [Table 5.4 Differential Clock Output Specifications on page 10](#).
- Removed “default low” from OEB pin descriptions.

Revision 0.7

September, 2019

- Initial release.
