

# LOW SKEW, 1-TO-12, DIFFERENTIAL-TO-3.3V, 2.5V LVPECL FANOUT BUFFER

ICS853S12I

## GENERAL DESCRIPTION

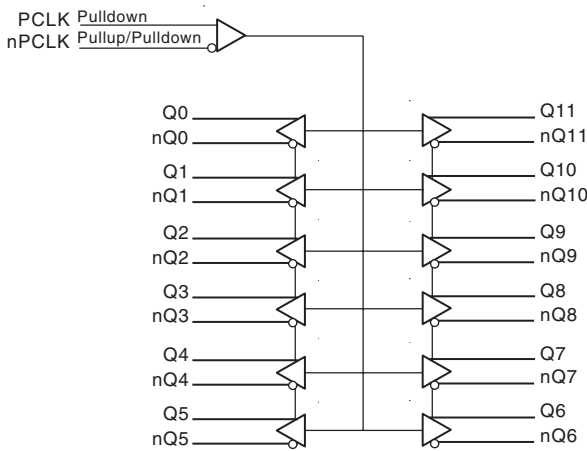

The ICS853S12I is a low skew, 1-to-12 Differential-to-3.3V, 2.5V LVPECL Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The PCLK, nPCLK pair accepts LVPECL, CML, and SSTL differential input levels. The high gain differential amplifier accepts peak-to-peak input voltages as small as 150mV, as long as the common mode voltage is within the specified minimum and maximum range.

Guaranteed output and part-to-part skew characteristics make the ICS853S12I ideal for those clock distribution applications demanding well defined performance and repeatability.

## FEATURES

- Twelve differential 3.3V, 2.5V LVPECL outputs
- PCLK, nPCLK input pair
- PCLK, nPCLK pair can accept the following differential input levels: LVPECL, CML, SSTL
- Maximum output frequency: 1.5GHz
- Translates any single-ended input signal to 2.5V or 3.3V LVPECL levels with a resistor bias on nPCLK input
- Additive phase jitter, RMS: 0.06ps (typical)
- Output skew: 50ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Propagation delay: 680ps (maximum)
- Full 3.3V or 2.5V operating supply modes
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

## BLOCK DIAGRAM

## PIN ASSIGNMENT

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 2	Q11, nQ11	Output		Differential output pair. LVPECL interface levels.
3, 6	V <sub>EE</sub>	Power		Negative supply pins.
4	PCLK	Input	Pulldown	Non-inverting differential clock input.
5	nPCLK	Input	Pullup/ Pulldown	Inverting differential clock input.
7, 8	Q0, nQ0	Output		Differential output pair. LVPECL interface levels.
9, 10	Q1, nQ1	Output		Differential output pair. LVPECL interface levels.
11, 16, 25, 30	V <sub>CC</sub>	Power		Positive supply pins.
12, 13	Q2, nQ2	Output		Differential output pair. LVPECL interface levels.
14, 15	Q3, nQ3	Output		Differential output pair. LVPECL interface levels.
17, 18	Q4, nQ4	Output		Differential output pair. LVPECL interface levels.
19, 20	Q5, nQ5	Output		Differential output pair. LVPECL interface levels..
21, 22	Q6, nQ6	Output		Differential output pair. LVPECL interface levels.
23, 24	Q7, nQ7	Output		Differential output pair. LVPECL interface levels.
28, 29	Q9, nQ9	Output		Differential output pair. LVPECL interface levels.
26, 27	Q8, nQ8	Output		Differential output pair. LVPECL interface levels.
31, 32	Q10, nQ10	Output		Differential output pair. LVPECL interface levels.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{CC}$	4.6V
Inputs, $V_I$	-0.5V to $V_{CC} + 0.5V$
Outputs, $I_O$	
Continuous Current	50mA
Surge Current	100mA
Package Thermal Impedance, $\theta_{JA}$	
For 32 Lead VFQFN	42.7°C/W (0 mps)
Storage Temperature, $T_{STG}$	-65°C to 150°C

**NOTE:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**TABLE 4A. POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = 3.3V \pm 5\%$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  TO  $85^\circ C$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$V_{CC}$	Positive Supply Voltage		3.135	3.3	3.465	V
$I_{EE}$	Power Supply Current				137	mA

**TABLE 4B. POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = 2.5V \pm 5\%$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  TO  $85^\circ C$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units

**TABLE 4C. LVPECL DC CHARACTERISTICS,  $V_{CC} = 3.3V \pm 5\%$  OR  $2.5V \pm 5\%$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  TO  $85^\circ C$** 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$I_{IH}$	Input High Current	PCLK	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$		150	$\mu A$
		nPCLK	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$		10	$\mu A$
$I_{IL}$	Input Low Current	PCLK	$V_{CC} = 3.465V$ or $2.625V$ , $V_{IN} = 0V$	-10		$\mu A$
		nPCLK	$V_{CC} = 3.465V$ or $2.625V$ , $V_{IN} = 0V$	-150		$\mu A$
$V_{PP}$	Peak-to-Peak Input Voltage		0.3		1.0	V
$V_{CMR}$	Common Mode Input Voltage; NOTE 1, 2		$V_{EE} + 1.5$		$V_{CC}$	V
$V_{OH}$	Output High Voltage; NOTE 3		$V_{CC} - 1.3$		$V_{CC} - 0.8$	V
$V_{OL}$	Output Low Voltage; NOTE 3		$V_{CC} - 2.0$		$V_{CC} - 1.6$	V
$V_{SWING}$	Peak-to-Peak Output Voltage Swing		0.6		1.0	V

NOTE 1: For single ended applications, the maximum input voltage for PCLK, nPCLK is  $V_{CC} + 0.3V$ .

NOTE 2: Common mode voltage is defined as  $V_{IH}$ .

NOTE 3: Outputs terminated with  $50\Omega$  to  $V_{CC} - 2V$ .

TABLE 5. AC CHARACTERISTICS,  $V_{CC} = 3.3V \pm 5\%$  OR ,  $V_{CC} = 2.5V \pm 5\%$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  TO  $85^\circ C$ 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$f_{MAX}$	Output Frequency				1.5	GHz
$t_{PD}$	Propagation Delay; NOTE 1		300		680	ps
$f_{jit}$	Buffer Additive Phase Jitter, RMS; refer to Additive Phase Jitter Section	622MHz, Integration Range: 12kHz – 20MHz		0.06		ps
$t_{sk(o)}$	Output Skew; NOTE 2, 4				50	ps
$t_{sk(pp)}$	Part-to-Part Skew; NOTE 3, 4				250	ps
$t_R / t_F$	Output Rise/Fall Time	20% to 80%	80		300	ps
odc	Output Duty Cycle		47		53	%

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz

band to the power in the fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the

device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{CC}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 1. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### RECOMMENDATIONS FOR UNUSED OUTPUT PINS

#### OUTPUTS:

##### LVPECL OUTPUTS:

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

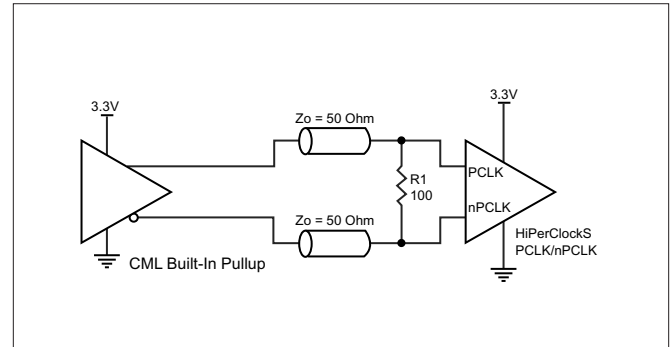

## LVPECL CLOCK INPUT INTERFACE

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{\text{SWING}}$  and  $V_{\text{OH}}$  must meet the  $V_{\text{PP}}$  and  $V_{\text{CMR}}$  input requirements. Figures 2A to 2E show interface examples for the HiPerClockS PCLK/nPCLK input driven by the most common driver types. The input interfaces suggest-

ed here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

### VFQFN EPAD THERMAL RELEASE PATH

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 3*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”)

are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, refer to the Application Note on the *Surface Mount Assembly* of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

**FIGURE 3. P.C. ASSEMBLY FOR EXPOSED PAD THERMAL RELEASE PATH –SIDE VIEW (DRAWING NOT TO SCALE)**

### TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

**TERMINATION FOR 2.5V LVPECL OUTPUTS**

Figure 5A and Figure 5B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating  $50\Omega$  to  $V_{cc} - 2V$ . For  $V_{cc} = 2.5V$ , the  $V_{cc} - 2V$  is very close to ground

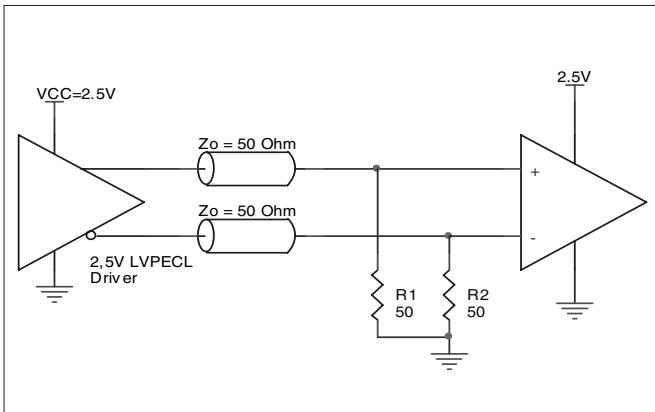

level. The R3 in Figure 5B can be eliminated and the termination is shown in Figure 5C.

**FIGURE 5A. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 5B. 2.5V LVPECL DRIVER TERMINATION EXAMPLE**

**FIGURE 5C. 2.5V LVPECL TERMINATION EXAMPLE**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853S12I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS853S12I is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC,MAX} * I_{EE,MAX} = 3.465V * 137mA = 474.7mW$
- Power (outputs)<sub>MAX</sub> = **32mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $12 * 32mW = 384mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 474.7mW + 384mW = 858.7mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd_{total} + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 42.7°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:  
 $85°C + 0.859W * 42.7°C/W = 121.7°C$ . This is below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 32 LEAD VFQFN, FORCED CONVECTION**

$\theta_{JA}$ vs. Air Flow (Meter per Second)			
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	42.7°C/W	37.3°C/W	33.5°C/W

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

**FIGURE 6. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.8V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.8V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.6V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.6V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.8V)/50\Omega] * 0.8V = 19.2mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.6V)/50\Omega] * 1.6V = 12.8mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 32mW$
