

Regulator - TinyPower™, Buck-Boost: 2.5 A, 1.8 MHz

FAN49100

Description

The FAN49100 is a high efficiency buck-boost switching mode regulator which accepts input voltages either above or below the regulated output voltage. Using fullbridge architecture with synchronous rectification, the FAN49100 is capable of delivering up to 2.5 A at 3.6 V input while regulating the output at 3.3 V. The FAN49100 exhibits seamless transition between step-up and step-down modes reducing output disturbances.

At moderate and light loads, Pulse Frequency Modulation (PFM) is used to operate the device in power-save mode to maintain high efficiency. In PFM mode, the part still exhibits excellent transient response during load steps. At moderate to heavier loads or Forced PWM mode, the regulator switches to PWM fixed-frequency control. While in PWM mode, the regulator operates at a nominal fixed frequency of 1.8 MHz, which allows for reduced external component values.

The FAN49100 is available in a 20-bump 1.615 mm x 2.015 mm with 0.4 mm pitch WLCSP.

Features

- 24 μ A Typical PFM Quiescent Current
- Above 95% Efficiency
- Total Layout Area = 11.61 mm²
- Input Voltage Range: 2.5 V to 5.5 V
- 1.8 MHz Fixed-Frequency Operation in PWM Mode
- Automatic / Seamless Step-up and Step-down
- Mode Transitions
- Forced PWM and Automatic PFM / PWM Mode Selection
- 0.5 μ A Typical Shutdown Current
- Low Quiescent Current Pass-Through Mode
- Internal Soft-Start and Output Discharge
- Low Ripple and Excellent Transient Response
- Internally Set, Automatic Safety Protections (UVLO, OTP, SCP, OCP)
- Package: 20 Bump, 0.4 mm Pitch WLCSP
- This Device is Pb-Free, Halogen Free / BFR Free

Applications

- Smart Phones
- Tablets, Netbooks, Ultra-Mobile PCs
- Portable Devices with Li-ion Battery
- 2G / 3G / 4G Power Amplifiers
- NFC Applications

PIN CONFIGURATION

Figure 3. Top View (Bump Down)

Table 2. PIN DEFINITIONS (Note 2)

Pin #	Name	Description
A3, A4	PVIN	Power Input Voltage. Connect to input power source. Connect to C_{IN} with minimal path.
A1	AVIN	Analog Input Voltage. Analog input for device. Connect to C_{IN} and PVIN.
A2	EN	Enable. A HIGH logic level on this pin forces the device to be enabled. A LOW logic level forces the device into shutdown. EN pin can be tied to VIN or driven via a GPIO logic voltage.
B3, B4	SW1	Switching Node 1. Connect to inductor L1.
E1	AGND	Analog Ground. Control block signal is referenced to this pin. Short AGND to PGND at GND pad of C_{OUT} .
B1, C1, C2, C3, C4, D1	PGND	Power Ground. Low-side MOSFET of buck and main MOSFET of boost are referenced to this pin. C_{IN} and C_{OUT} should be returned with a minimal path to these pins.
D2	MODE	Forced PWM / AUTO Mode. HIGH logic level on this pin forces the chip to stay in PWM mode, while LOW logic level allows the chip to automatically switch between PFM and PWM modes. Don't leave the pin floating.
D3, D4	SW2	Switching Node 2. Connect to inductor L1.
E2	PG	Power Good. This is an open-drain output and normally High Z. An external pull-up resistor from VOUT can be used to generate a logic HIGH. PG is pulled LOW if output falls out of regulation due to current overload or if thermal protection threshold is exceeded. If EN is LOW, PG is high impedance.
B2	PT	Pass-Through. HIGH logic level forces Pass-Through mode. A LOW logic level forces normal operation. Don't leave the pin floating.
E3, E4	VOUT	Output Voltage. Buck-Boost Output. Connect to output load and C_{OUT} .

2. Refer to Layout Recommendation section located near the end of the datasheet.

FAN49100

Table 3. ABSOLUTE MAXIMUM RATINGS ($T_A = 25^{\circ}\text{C}$, Unless otherwise specified)

Symbol	Parameter		Min.	Max.	Unit
PVIN/AVIN	PVIN/AVIN Voltage		−0.3	6.5	V
VOUT	VOUT Voltage		−0.3	6.5	V
SW1, SW2	SW Nodes Voltage		−0.3	7.0	V
	Other Pins		−0.3	6.5	V
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22−A114	2000		V
		Charged Device Model per JESD22−C101	1000		
T _J	Junction Temperature		−40	+150	°C
T _{STG}	Storage Temperature		−65	+150	°C
T _L	Lead Soldering Temperature, 10 Seconds			+260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 4. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min.	Typ.	Max.	Unit
PVIN	Supply Voltage Range	2.5		5.5	V
I_{OUT}	Output Current (Note 3)	0		2.5	A
L	Inductor (Note 4)		1		μH
C_{OUT}	Output Capacitance (Note 4)		47		μF
T_A	Operating Ambient Temperature	-40		+85	$^{\circ}\text{C}$
T_J	Operating Junction Temperature	-40		+125	$^{\circ}\text{C}$

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

- Maximum current may be limited by the thermal conditions of the end application, PCB layout, and external component selection in addition to the device's thermal properties. Refer to the Application Information and Application Guidelines sections for more information.
- Refer to the Application Guidelines section for details on external component selection.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

- Refer to Typical Characteristics waveforms/graphs for Closed-Loop data and its variation with input voltage and ambient temperature. Electrical Characteristics reflects Open-Loop steady state data. System Characteristics reflects both steady state and dynamic Close-Loop data associated with the recommended external components.
- Minimum and Maximum limits are verified by design, test, or statistical analysis. Typical (Typ.) values are not tested, but represent the parametric norm.
- Device is not switching.

Table 7. SYSTEM CHARACTERISTICS

The following table is verified by design and bench test while using circuit of Figure 1 with the recommended external components. Typical values are at $T_A = 25^\circ\text{C}$, $P_{VIN} = A_{VIN} = V_{EN} = 3.6\text{ V}$, $V_{OUT} = 3.3\text{ V}$. These parameters are not verified in production.

APPLICATION INFORMATION

Functional Description

FAN49100 is a fully integrated synchronous, full bridge DC-DC converter that can operate in buck operation (during high P_{VIN}), boost operation (for low P_{VIN}) and a combination of buck-boost operation when P_{VIN} is close to the target V_{OUT} value. The PWM/PFM controller switches automatically and seamlessly between buck, buck-boost and boost modes.

The FAN49100 uses a four-switch operation during each switching period when in the buck-boost mode. Mode operation is as follows: referring to the power drive stage shown in Figure 29, if P_{VIN} is greater than target V_{OUT} , then the converter is in buck mode: Q3 is ON and Q4 is OFF continuously leaving Q1, Q2 to operate as a current-mode controlled PWM converter. If P_{VIN} is lower than target V_{OUT} then the converter is in boost mode with Q1 ON and Q2 OFF continuously, while leaving Q3, Q4 to operate as a current-mode boost converter. When P_{VIN} is near V_{OUT} , the converter goes into a 3-phase operation in which combines a buck phase, a boost phase and a reset phase; all switches are switching to maintain an average inductor volt-second balance.

Figure 29. Simplified Block Diagram

PFM/PWM Mode

The FAN49100 uses a current-mode modulator to achieve smooth transitions between PWM and PFM operation. In Pulsed Frequency Modulation (PFM), frequency is reduced to maintain high efficiency. During PFM operation, the converter positions the output voltage typically 75 mV higher than the nominal output voltage during PWM operation, allowing additional headroom for voltage drop during a load transient from light to heavy load. As the load increased from light loads, the converter enters PWM operation typically at 300 mA of current load. The converter switching frequency is typically 1.8 MHz during PWM operation for moderate to heavy load currents.

PT (Pass-Through) Mode

In Pass-Through mode, all of the switches are not switching and V_{OUT} tracks P_{VIN} ($V_{OUT} = P_{VIN} - I_{OUT} \times (Q1_{RDS(on)} + Q3_{RDS(on)} + L_{DCR})$). In PT mode only Over-Temperature (OTP) and Under Voltage Lockout (UVLO) protection circuits are activated. There is no Over-Current Protection (OCP) in PT mode.

Shutdown and Startup

When the EN pin is LOW, the IC is shut down, all internal circuits are off, and the part draws very little current. During shutdown, V_{OUT} is isolated from P_{VIN} . Raising EN pin activates the device and begins the softstart cycle. During soft-start, the modulator's internal reference is ramped slowly to minimize surge currents on the input and prevent overshoot of the output voltage. If V_{OUT} fails to reach target V_{OUT} value after 1 ms, a FAULT condition is declared.

Over-Temperature (OTP)

The regulator shuts down when the die temperature exceeds 150°C. Restart occurs when the IC has cooled by approximately 20°C.

Output Discharge

When the regulator is disabled and driving the EN pin LOW, a 230 Ω internal resistor is activated between VOUT and GND. The Output Discharge is not activated during a FAULT state condition.

Over-Current Protection (OCP)

If the peak current limit is activated for a typical 700 μs, a FAULT state is generated, so that the IC protects itself as well as external components and load.

FAULT State

The regulator enters the FAULT state under any of the following conditions:

- VOUT fails to achieve the voltage required after soft-start
- Peak current limit triggers
- OTP or UVLO are triggered

Once a FAULT is triggered, the regulator stops switching and presents a high-impedance path between PVIN and VOUT. After waiting 30 ms, a restart is attempted. The regulator shuts down when the die temperature exceeds 150°C. Restart occurs when the IC has cooled by approximately 20°C.

Power Good

PG, an open-drain output, is LOW during FAULT state and HIGH for Power Good. The PG pin is provided for signaling the system when the regulator has successfully completed soft-start and no FAULTs have occurred. PG pin also functions as a warning flag for high die temperature and overload conditions.

- PG is released HIGH when the soft-start sequence is successfully completed.
- PG is pulled LOW when a FAULT is declared.

Any FAULT condition causes PG to be de-asserted.

Thermal Considerations

For best performance, the die temperature and the power dissipated should be kept at moderate values. The maximum power dissipated can be evaluated based on the following relationship:

$$P_{D(max)} = \left\{ \frac{T_{J(max)} - T_A}{\theta_{JA}} \right\}$$

where $T_{J(max)}$ is the maximum allowable junction temperature of the die; T_A is the ambient operating temperature; and θ_{JA} is dependent on the surrounding PCB layout and can be improved by providing a heat sink of surrounding copper ground. The addition of backside copper with through-holes, stiffeners, and other enhancements can help reduce θ_{JA} . The heat contributed by the dissipation of devices nearby must be included in design considerations. Following the layout recommendation may lower the θ_{JA} .

APPLICATION GUIDELINES**Table 8. RECOMMENDED EXTERNAL COMPONENTS**

Reference Designator	Description	Quantity	Part Number
L	1 μH, Isat(max) = 4.2 A, 36 mΩ(max), 2016	1	Cyntec HTEH20161T-1R0MSR
C _{OUT}	47 μF (x2), 6.3 V, X5R, 1608	2	Murata GRM188R60J476ME15
C _{IN}	22 μF, 10 V, X5R, 1608	1	Murata GRM187R61A226ME15

Alternative External Components

It is recommended to use the external components in Table 8. Alternative components that are suitable for a design's specific requirements must also meet the IC's requirements for proper device operation.

De-rating factors should be taken into consideration to ensure selected components meet minimum requirements.

Output Capacitor (C_{OUT})

As shown in the recommended layout, C_{OUT} must connect to the VOUT pin with the lowest impedance trace possible. Additionally, C_{OUT} must connect to the GND pin with the lowest impedance possible.

Smaller-than-recommended value output capacitors may be used for applications with reduced load current requirements. When selecting capacitors for minimal solution size, it must be noted that the effective capacitance (C_{EFF}) of small, high-value, ceramic capacitors will decrease as bias voltage increases. The effects of Bias Voltage (DC Bias Characteristics), Tolerance, and Temperature should be included when determining a component's effective capacitance.

The FAN49100 is guaranteed for stable operation with no less than the minimum effective output capacitance values shown in Table 9.

FAN49100

Table 9. REQUIRED MINIMUM EFFECTIVE OUTPUT CAPACITANCE VERSUS MAXIMUM LOAD

Maximum Load Current	Inductor (μ H)	Required Minimum Effective Output Capacitance (μ F)
≤ 2000 mA	1.0	15
	0.47	9
≤ 1500 mA	1.0	12
≤ 1000 mA	1.0	9
≤ 600 mA	1.0	7
≤ 500 mA	1.0	6

Table 10. EFFECTIVE CAPACITANCE VERSUS PART NUMBER

PN	Size (mm) LW x H	Nominal Value (μ F)	Rating (V)	Tol. (%)	Bias (V)	Effective Capacitance (μ F) Due to Bias, Temperature and Tolerance
Murata GRM188R60J476ME15	1608 x 1.0	47	6.3	20	3.4	8.5
Murata GRM187R61A226ME15	1608 x 0.8	22	10	20	3.4	6.3
					5	4.2
Murata GRM188R61A106KE69	1608 x 1.0	10	10	10	3.4	3.2
					5	2.3

Input Capacitor (C_{IN})

As shown in the recommended layout, C_{IN} must connect to the PVIN pin with the lowest impedance trace possible. Additionally, C_{IN} must connect to the GND pin with the lowest impedance possible.

The FAN49100 is guaranteed for stable operation with a minimum effective capacitance of 2 μ F. It is recommended to use a high quality input capacitor rated at 10 μ F nominal or greater. Additional capacitance is required when the FAN49100's power source is not located close to the device.

Inductor (L)

As shown in the recommended layout, the inductor (L) must connect to the SW1 and SW2 pins with the lowest impedance trace possible.

The recommended nominal inductance value is 1.0 μ H. A value of 0.47 μ H can be used, but higher peak currents should be expected.

The FAN49100 employs peak current limiting, and the peak inductor current can reach I_{P_LIM} before limiting, therefore current saturation should be considered when choosing an inductor.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
