

NCP4687

Linear Voltage Regulator, LDO, High PSRR, 500 mA

The NCP4687 is a CMOS 500 mA LDO linear voltage regulator with high output voltage accuracy which features a high ripple rejection, low supply current with low dropout and chip enable with built-in low $R_{DS(on)}$ NMOS transistor for fast output capacitor discharging as option. The device is composed of the voltage reference unit, error amplifier, resistor divider for output voltage sensing or precise output voltage setting. The current limit and thermal shutdown makes the device very suitable for industrial applications and portable communication equipments.

Features

- Operating Input Voltage Range: 2.5 V to 5.25 V
- Output Voltage Range: 0.7 to 3.6 V (available in 0.1 V steps)
- $\pm 0.8\%$ Output Voltage Accuracy @ $V_{out} > 1.8$ V
- Output noise : 40 μV_{rms}
- Line Regulation: 0.02%/V
- Current Limit Circuit
- High PSRR: 75 dB at 1 kHz, 70 dB at 10 kHz
- Thermal Shutdown
- Available in SOT-23-5, SOT-89-5 and uDFN 1.2 x 1.2 mm Packages
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Home Appliances, Industrial Equipment
- DVB-T and DVB-S Receivers
- Car Audio Equipment, Navigation Systems
- Notebook Adaptors, LCD TVs, Cordless Phones and Private LAN Systems

APPLICATION INFORMATION

A typical application circuit for NCP4687 series is shown in the Figure 39.

Figure 39. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 1.0 μF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4687 device. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 1.0 μF ceramic output decoupling capacitor is sufficient to achieve stable operation of the device. If tantalum capacitor is used, and its ESR is high, the loop oscillation may result. The capacitor should be connected as close as possible to the output and ground pin. Larger values and lower ESR improves dynamic parameters.

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull

down current source which assure off state of LDO in case the CE pin will stay floating. If the enable function is not needed connect CE pin to V_{IN} .

The D version of the NCP4687 device includes a transistor between V_{OUT} and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal Consideration

As a power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

The IC includes internal thermal shutdown circuit that stops operation of regulator, if junction temperature is higher than 165°C. After that, when junction temperature decreases below 100°C, the operation of voltage regulator would restart. While high power dissipation condition is, the regulator starts and stops repeatedly and protects itself against overheating.

Sense Pin

The SENSE pin improves significantly the load regulation. The connection resistance between the LDO and the load given by PCB parameters has reduced impact to load regulation. If possible, use wide PCB traces as short as possible.
